Document Title

4(2)M x 8(16) Bit x 4 Banks (128-MBIT) SDRAM

Revision History

Revision No	History	Draft Date	Remark
0A	Initial Draft	August 27,2001	
0B	Corrected typo on PIN FUNCTIONS and revise DC OPERATING CONDITIONS	May 6,2002	
0C	Append two parameters t_{DPL} ,t_{DAL};correct t_{RCD} and t_{RP} and modify DC operating condition	August 21,2003	
0D	1.Obsolete speed grade -7H 2.Support Pb-free package 3.Modify typo in page 16,17	September 09,2003	
0E	Add Industrial range Change $I_{CC}5$ from 160mA to 180mA	June 11,2004	

4(2)M x 8(16) Bits x 4 Banks (128-MBIT) SYNCHRONOUS DYNAMIC RAM

FEATURES

- Single 3.3V (± 0.3V) power supply
- High speed clock cycle time -6: 166MHz<3-3-3>, -7H: 133MHz<2-2-2>, -7: 133MHz<3-3-3>, -8: 100MHz<2-2-2>
- Fully synchronous operation referenced to clock rising edge
- Possible to assert random column access in every cycle
- Quad internal banks contorlled by BA0 & BA1 (Bank Select)
- Byte control by LDQM and UDQM for IC42S16800
- Programmable Wrap sequence (Sequential / Interleave)
- Programmable burst length (1, 2, 4, 8 and full page)
- Programmable $\overline{\text{CAS}}$ latency (2 and 3)
- Automatic precharge and controlled precharge
- CBR (Auto) refresh and self refresh
- X8, X16 organization
- LVTTL compatible inputs and outputs
- 4,096 refresh cycles / 64ms
- Burst termination by Burst stop and Precharge command
- Package 400mil 54-pin TSOP-2

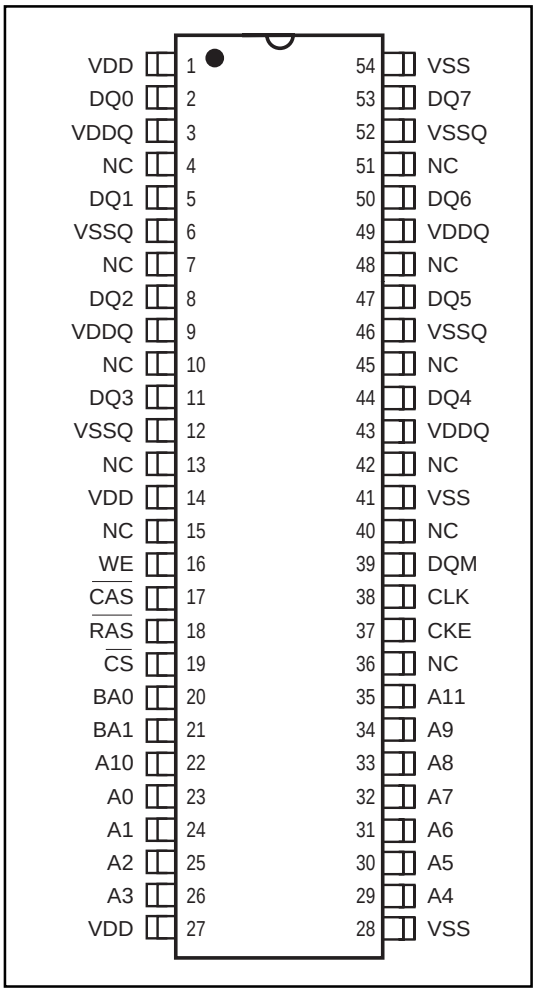
DESCRIPTION

The IC42S81600 and IC42S16800 are high-speed 134,217,728-bit synchronous dynamic random-access memories, organized as 4,194,304 x 8 x 4 and 2,097,152 x 16 x 4 (word x bit x bank), respectively.

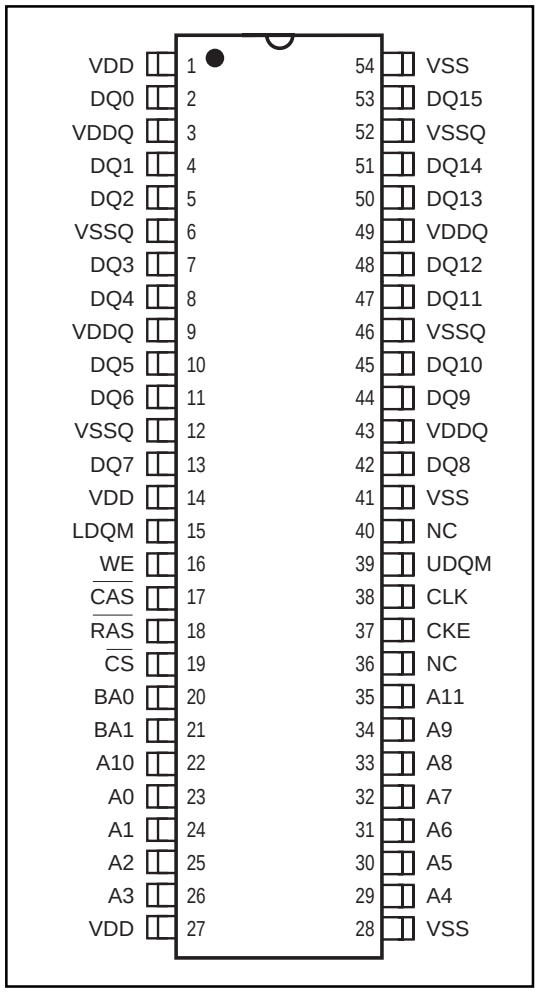
The synchronous DRAMs achieved high-speed data transfer using the pipeline architecture. All input and outputs are synchronized with the positive edge of the clock.The synchronous DRAMs are compatible with Low Voltage TTL (LVTTL).These products are packaged in 54-pin TSOP-2.

PIN CONFIGURATIONS

54-Pin TSOP-2 (IC42S81600)



54-Pin TSOP-2 (IC42S16800)

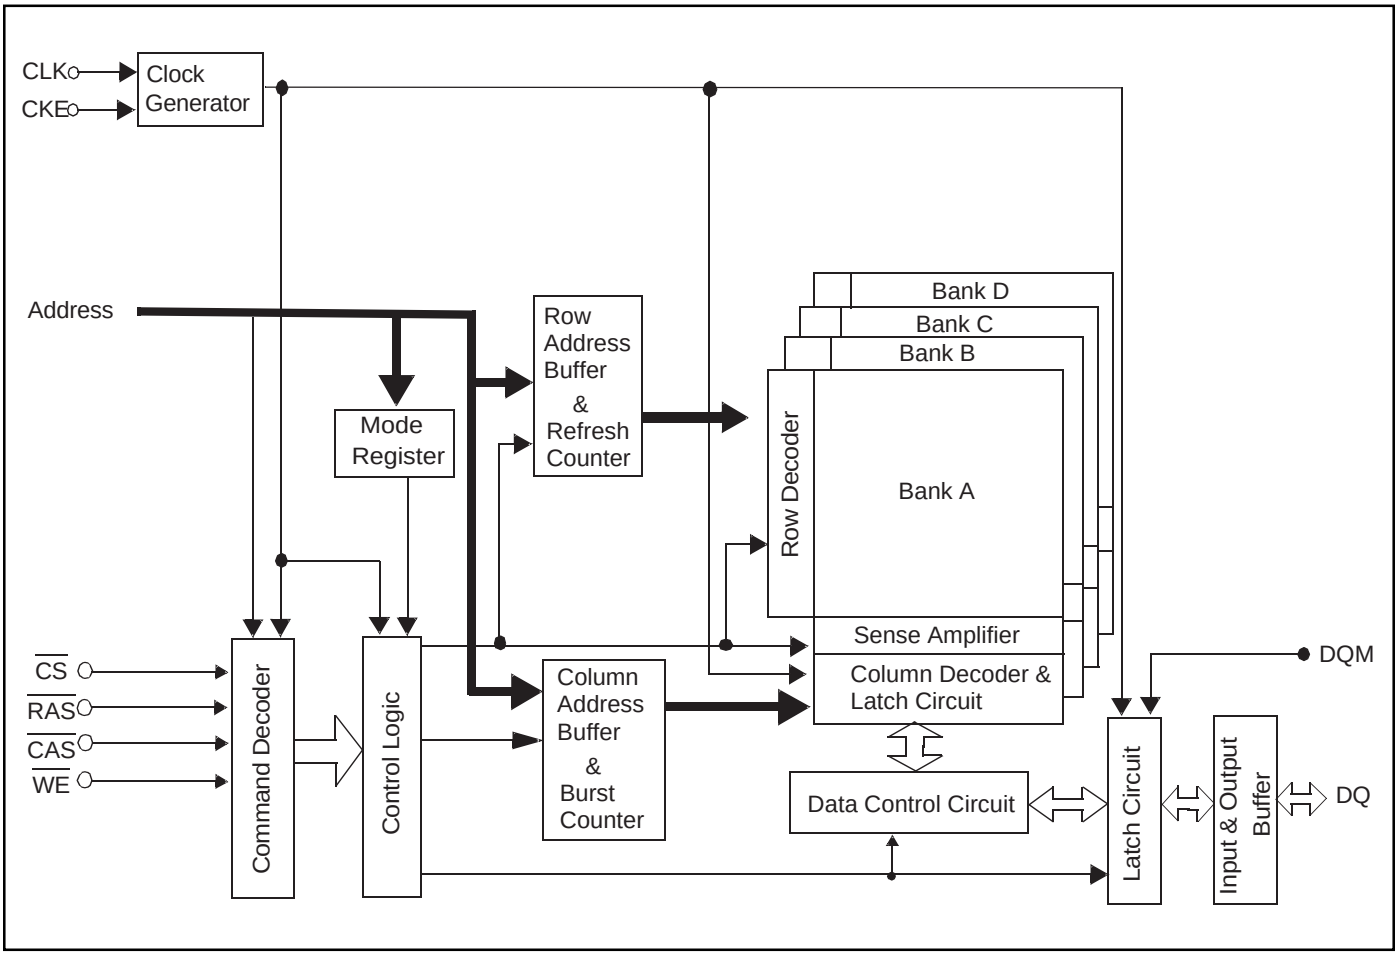


PIN DESCRIPTIONS

Pin Name	Function
CLK	Master Clock
CKE	Clock Enable
$\overline{CS}$	Chip Select
$\overline{RAS}$	Row Address Strobe
$\overline{CAS}$	Column Address Strobe
$\overline{WE}$	Write Enable
DQ0 ~ DQ15	Data I/O

Pin Name	Function
DQM	DQ Mask Enable
A0-11	Address Input
BA0,1	Bank Address
V_{DD}	Power Supply
V_{DDQ}	Power Supply for DQ
V_{SS}	Ground
V_{SSQ}	Ground for DQ

FUNCTIONAL BLOCK DIAGRAM



PIN FUNCTIONS

Symbol	Type	Function (In Detail)
CLK	Input Pin	Master Clock: Other inputs signals are refereneed to the CLK rising edge
CKE	Input Pin	Clock Enable: CKE HIGH activates, and CKE LOW deactivates internal clock signals,device input buffers and output drivers. Deactivating the clock provides PRECHARGE POWER-DOWN and SELF REFRESH operation (all banks idle), or ACTIVE POWER-DOWN (row ACTIVE in any bank).
$\overline{CS}$	Input Pin	Chip Select: $\overline{CS}$ enables (registered LOW) and disables (registered HIGH) the command decoder. All commands are masked when $\overline{CS}$ is registered HIGH. $\overline{CS}$ provides for external bank selection on systems with multiple banks. $\overline{CS}$ is considered part of the command code.
$\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$	Input Pin	Command Inputs: $\overline{RAS}$, $\overline{CAS}$ and $\overline{WE}$ (along with $\overline{CS}$) define the command being entered.
A0-A11	Input Pin	Address Inputs: Provide the row address for ACTIVE commands, and the column address and AUTO PRECHARGE bit for READ/WRITE commands, to select one location out of the memory array in the respective bank. The row address is specified by A0-A11. The column address is specified by A0-A9 (IC42S81600) / A0-A8 (IC42S16800)
BA0,BA1	Input Pin	Bank Address Inputs: BA0 and BA1 define to which bank an ACTIVE, READ, WRITE or PRECHARGE command is being applied.
DQM, UDQM ,LDQM	Input Pin	Din Mask / Output Disable: When DQM is high in burst write, Din for the current cycle is masked. When DQM is is high in burst read, Dout is disable at the next but one cycle.
DQ0 to DQ15	I/O Pin	Data Input / Output: Data bus.
V_{DD}, V_{SS}	Power Supply Pin	Power Supply for the memory array and peripheral circuitry.
V_{DDQ}, V_{SSQ}	Power Supply Pin	Power Supply are supplied to the output buffers only.

ABSOLUTE MAXIMUM RATINGS(1)

Symbol	Parameters		Rating	Unit
V_{DD}	Supply Voltage (with respect to V_{SS})		–0.5 to +4.6	V
V_{DDQ}	Supply Voltage for Output (with respect to V_{SSQ})		–0.5 to +4.6	V
V_I	Input Voltage (with respect to V_{SS})		–0.5 to V_{DD}+0.5	V
V_O	Output Voltage (with respect to V_{SSQ})		–1.0 to V_{DDQ}+0.5	V
I_O	Short circuit output current		50	mA
P_D	Power Dissipation (T_A = 25 °C)		1	W
T_{OPT}	Operating Temperature	Commercial Industrial	0 to +70 -40 to +85	°C
T_{STG}	Storage Temperature		–65 to +150	°C

Notes:
1. Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

DC RECOMMENDED OPERATING CONDITIONS

(At unless otherwise noted)

Symbol	Parameter	Min.	Typ.	Max.	Unit
V_{DD}	Supply Voltage	3.0	3.3	3.6	V
V_{DDQ}	Supply Voltage for DQ	3.0	3.3	3.6	V
V_{IH}	High Level Input Voltage (all Inputs)	2.0	—	V_{DD} + 1.2	V
V_{IL}	Low Level Input Voltage (all Inputs)	-1.2	—	+0.8	V

Notes:
1. All voltages are referenced to V_{SS} =0V
2. V_{IH}(max) for pulse width with ≤ 3ns of duration
3. V_{IL}(min) for pulse width with ≤ 3ns of duration

CAPACITANCE CHARACTERISTICS

(At V_{DD} = V_{DDQ} = 3.3 ± 0.3V, V_{SS} = V_{SSQ} = 0V , unless otherwise noted)

Symbol	Parameter	Min.	Max.		Unit
			-6	-7/-8	
C_{IN}	Input Capacitance, address & control pin	2.5	3.8	5.0	pF
C_{CLK}	Input Capacitance, CLK pin	2.5	3.5	4.0	pF
$C_{I/O}$	Data Input/Output Capacitance	4.0	6.5	6.5	pF

DC CHARACTERISTICS 1

(V_{DD} = V_{DDQ} = 3.3 ± 0.3V, V_{SS} = V_{SSQ} = 0V , unless otherwise noted)

Symbol	Parameter	Test Condition	Organization	Max. -6	Max. -7	Max. -8	Unit
I_{CC1}(1)	Operating Current	One Bank active, CL=3, BL=1	x8	120	100	100	mA
			x16	140	120	120	mA
	t_{RC} = t_{RC} (min.)	t_{CLK} = t_{CLK} (min.)					
I_{CC2P}	Precharge Standby Current (In Power-Down Mode)	CKE ≤ V_{IL} (MAX) t_{CK} = 15 ns	x8/x16	2	2	2	mA
I_{CC2PS}		CKE ≤ V_{IL} (MAX) CLK ≤ V_{IL} (MAX)	x8/x16	1	1	1	mA
I_{CC2N}(2)	Precharge Standby Current (In Non Power-Down Mode)	$\overline{CS}$ ≥ V_{CC} -0.2V CKE ≥ V_{IH} (MIN) t_{CK} = 15 ns	x8/x16	25	25	25	mA
I_{CC2NS}		$\overline{CS}$ ≥ V_{CC} -0.2V CKE ≥ V_{IH} (MIN) CKE ≤ V_{IL} (MAX) All input signals are stable.	x8/x16	15	15	15	mA
I_{CC3N}(2)	Active Standby Current (In Non Power-Down Mode)	$\overline{CS}$ ≥ V_{CC} -0.2V CKE ≥ V_{IH} (MIN) t_{CK} = 15 ns	x8/x16	30	30	30	mA
I_{CC3NS}		$\overline{CS}$ ≥ V_{CC} -0.2V CKE ≥ V_{IH} (MIN) CKE ≤ V_{IL} (MAX) All input signals are stable.	x8/x16	20	20	20	mA
I_{CC4}	Operating Current (In Burst Mode)	All Banks active BL=4	x8	170	120	120	mA
		t_{CK} = t_{CK} (MIN)	x16	180	130	130	mA
	CL latency = 3						
I_{CC5}	Auto-Refresh Current	t_{RC} = t_{RC} (MIN) t_{CLK} = t_{CLK} (MIN)	x8/x16	180	160	160	mA
I_{CC6}(3, 4)	Self-Refresh Current	CKE ≤ 0.2V	x8/x16, normal	2	2	2	mA
			x8/x16, Low power	0.8	0.8	0.8	mA

Notes:
1. I_{CC}(max) is specified at the output open condition.
2. Input signals are changed one time during 30ns.
3. Normal version: IC42S81600/IC42S16800
4. Low power version: IC42S81600L/IC42S16800L

DC CHARACTERISTICS 2

(V_{DD} = 3.3 ± 0.3V, V_{SS} = V_{SSQ} = 0V , unless otherwise noted)

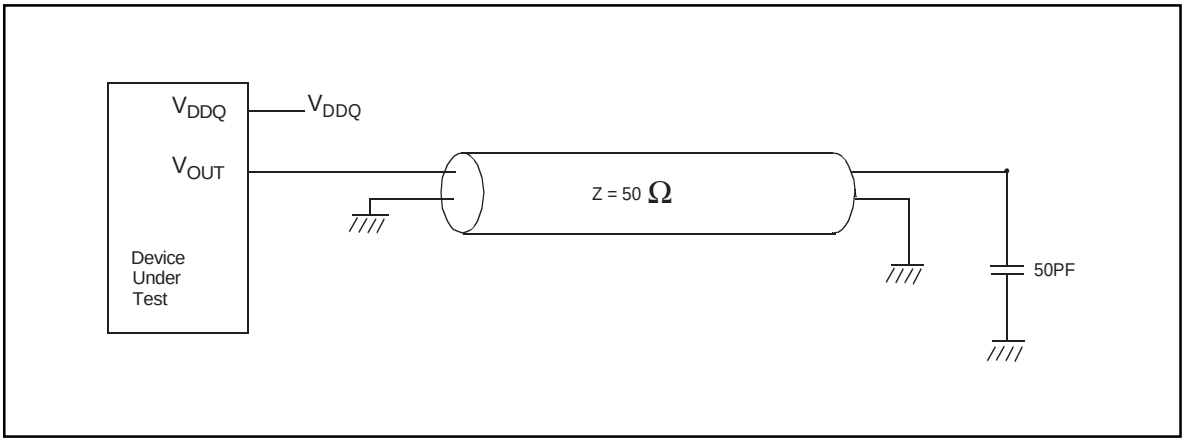
Parameter	Symbol	Test Condition	Min	Max	Unit
Input Leakage Current (Inputs)	$I_{I(L)}$	0 ≤ V_{IN} ≤ V_{DD} (MAX) Pins not under test = 0V	–10	10	µA
Output Leakage Current (I/O pins)	$I_{O(L)}$	0 ≤ V_{OUT} ≤ V_{DD} (MAX) DQ# in H - Z., D_{OUT} is disabled	–5	5	µA
High Level Output Voltage	V_{OH} (DC)	I_{OH} = –2 mA	2.4	—	V
Low Level Output Voltage	V_{OL} (DC)	I_{OL} = 2 mA	—	0.4	V

AC TEST CONDITIONS

(At V_{DD} = V_{DDQ} = 3.3 ± 0.3V, V_{SS} = V_{SSQ} = 0V , unless otherwise noted)

Parameter	Rating	Unit
AC input Levels (V_{IH} /V_{IL})	2.0 / 0.8	V
Input timing reference level /Output timing reference level	1.4	V
Input rise and fall time	1	ns
Output load condition	50	pF

Output Load Conditions



AC ELECTRICAL CHARACTERISTICS

(At V_{DD} = V_{DDQ} = 3.3 ± 0.3V, V_{SS} = V_{SSQ} = 0V , unless otherwise noted)

Notes:
1. All entries assume that CKE was active (High level) during the preceding clock cycle.
2. If both banks are idle, and CKE is inactive (Low level), the device will enter Power downmode. All input buffers except CKE will be disabled.
3. Illegal to bank in specified states; Function may be legal in the bank indicated by Bank Address(BA), depending on the state of that bank.
4. If both banks are idle, and CKE is inactive (Low level), the device will enter Self refresh mode. All input buffers except CKE will be disabled.
5. Illegal if t_{RCD} is not satisfied.
6. Illegal if t_{RAS} is not satisfied.
7. Must satisfy burst interrupt condition.
8. Must satisfy bus contention, bus turn around, and/or write recovery requirements.
9. Must mask preceding data which don't satisfy t_{DPL} .
10. Illegal if t_{RRD} is not satisfied.
11. Illegal for single bank, but legal for other banks in multi-bank devices.

CKE RELATED COMMAND TRUTH TABLE[1]

Notes:
1. H : Hight level, L : low level, X : High or low level (Don't care).
2. CKE Low to High transition will re-enable CLK and other inputs asynchronously. A minimum setup time must be satisfied before any command other than EXIT.
3. Power down and Self refresh can be entered only from the both banks idle state.
4. Must be legal command as defined in Operative Command Table.
5. Illegal if t_{SREX} is not satisfied.

Initiallization

Before starting normal operation, the following power on sequence is necessary to prevent SDRAM from damged or malfunctioning.

1. Apply power and start clock. Attempt to maintain CKE high , DQN high and NOP condition at the inputs.
2. Maintain stable power, table clock , and NOP input conditions for a minimum of 200us.
3. Issue precharge commands for all bank. (PRE or PALL)
4. After all banks become idle state (after t_{RP}), issue 8 or more auto-refresh commands.
5. Issue a mode register set command to initialize the mode regiser.

After these sequence, the SDRAM is in idle state and ready for normal operation.

Programming the Mode Register

The mode register is programmed by the mode register set command using address bits A13 through A0 as data inputs. The register retains data until it is reprogrammed or the device loses power.
The mode register has four fields;

Options : A13 through A7
$\overline{\text{CAS}}$ latency : A6 through A4
Wrap type : A3
Burst length : A2 through A0

Following mode register programming, no command can be asserted befor at least two clock cycles have elapsed.

$\overline{\text{CAS}}$ Latency

$\overline{\text{CAS}}$ latency is the most critical parameter being set. It tells the device how many clocks must elapse before the data will be available.
The value is determined by the frequency of the clock and the speed grade of the device. The value can be programmed as 2 or 3.

Burst Length

Burst Length is the number of words that will be output or input in read or write cycle. After a read burst is completed, the output bus will become high impedance.
The burst length is programmable as 1, 2, 4, 8 or full page.

Wrap Type (Burst Sequence)

The wrap type specifies the order in which the burst data will be addressed. The order is programmable as either “Sequential” or “Interleave”. The method chosen will depend on the type of CPU in the system.

MODE REGISTER

	Bits2 - 0	WT = 0	WT = 1
Burst length	000	1	1
	001	2	2
	010	4	4
	011	8	8
	100	R	R
	101	R	R
	110	R	R
	111	Fullpage	R

Wrap type	0	Sequential
	1	Interleave

	Bits 6-4	$\overline{\text{CAS}}$ latency
Latency mode	000	R
	001	R
	010	2
	011	3
	100	R
	101	R
	110	R
	111	R

Remark R : Reserved

Burst Length and Sequence

Burst of Two

Starting Address (column address A0, binary)	Sequential Addressing Sequence (decimal)	Interleave Addressing Sequence (decimal)
0	0, 1	0, 1
1	1, 0	1, 0

Burst of Four

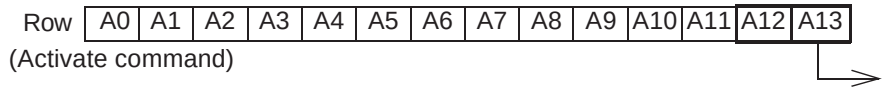
Starting Address (column address A1 - A0, binary)	Sequential Addressing Sequence (decimal)	Interleave Addressing Sequence (decimal)
00	0, 1, 2, 3	0, 1, 2, 3
01	1, 2, 3, 0	1, 0, 3, 2
10	2, 3, 0, 1	2, 3, 0, 1
11	3, 0, 1, 2	3, 2, 1, 0

Burst of Eight

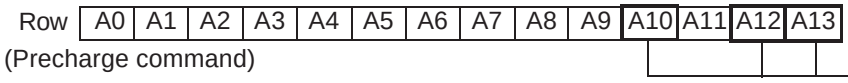
Starting Address (column address A2 - A0, binary)	Sequential Addressing Sequence (decimal)	Interleave Addressing Sequence (decimal)
000	0, 1, 2, 3, 4, 5, 6, 7	0, 1, 2, 3, 4, 5, 6, 7
001	1, 2, 3, 4, 5, 6, 7, 0	1, 0, 3, 2, 5, 4, 7, 6
010	2, 3, 4, 5, 6, 7, 0, 1	2, 3, 0, 1, 6, 7, 4, 5
011	3, 4, 5, 6, 7, 0, 1 ,2	3, 2, 1, 0, 7, 6, 5, 4
100	4, 5, 6, 7, 0, 1, 2, 3	4, 5, 6, 7, 0, 1, 2, 3
101	5, 6 ,7, 0, 1, 2, 3, 4	5, 4, 7, 6, 1, 0, 3, 2
110	6, 7 ,0 ,1 ,2 ,3 ,4 ,5	6, 7, 4, 5, 2, 3, 0, 1
111	7, 0, 1, 2, 3, 4, 5, 6	7, 6, 5, 4, 3, 2, 1, 0

Full page burst is an extension of the above tables of sequential addressing, with the length being 512 (for 16M x 8) and 256 (for 8Mx16).

Address Bits of Bank-Select and Precharge



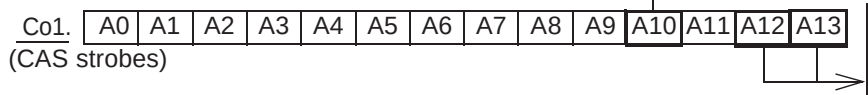
A12	A13	Result
0	0	Select Bank A “Activate “ command
0	1	Select Bank B “Activate” command
1	0	Select Bank C “Activate” command
1	1	Select Bank D “Activate” command



A10	A12	A13	Result
0	0	0	Precharge Bank A
0	0	1	Precharge Bank B
0	1	0	Precharge Bank C
0	1	1	Precharge Bank D
1	X	X	Precharge All Banks

X: Don't care

0	Disable Auto-Precharge (End of Burst)
1	Enable Auto - Precharge (End of Burst)



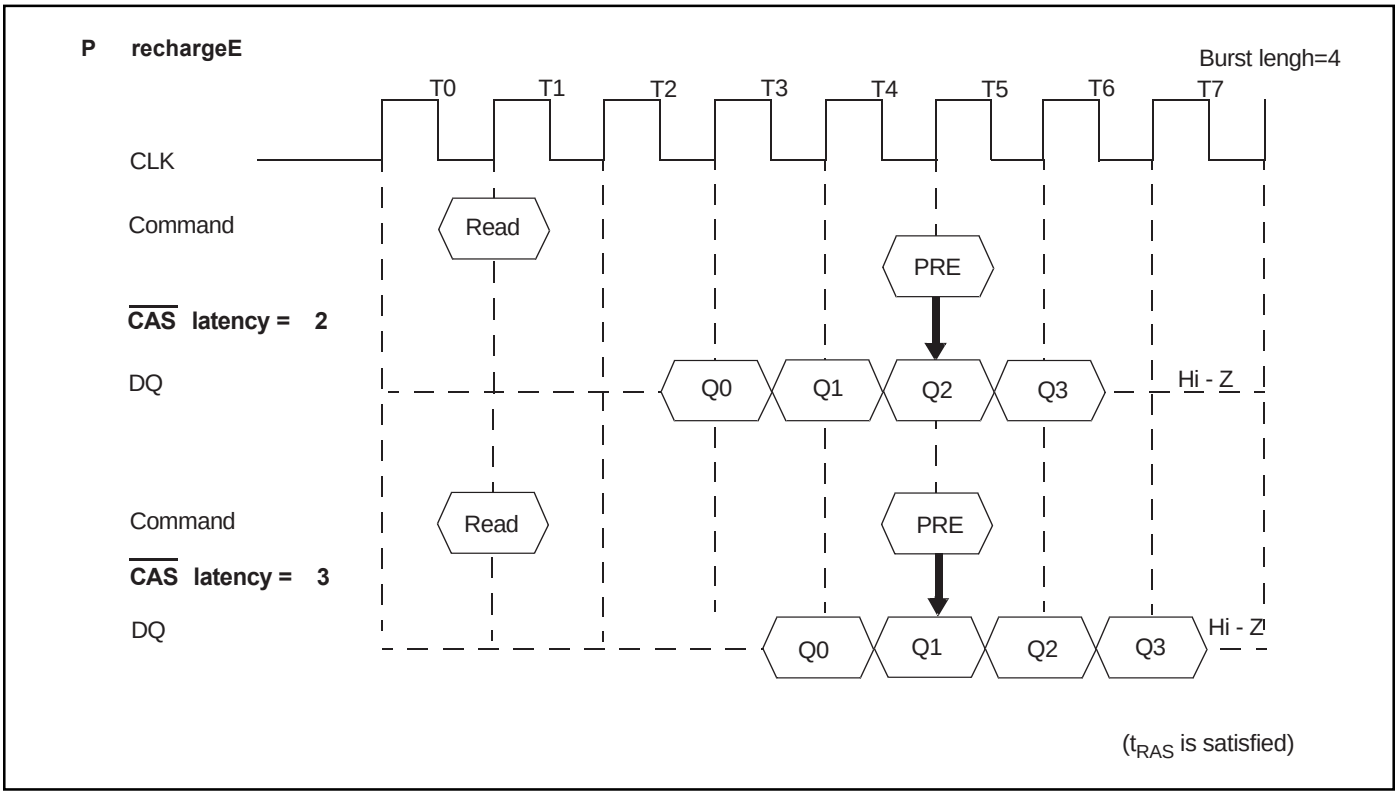
A12	A13	Result
0	0	Enable Read/Write commands for Bank A
0	1	Enable Read/Write commands for Bank B
1	0	Enable Read/Write commands for Bank C
1	1	Enable Read/Write commands for Bank D

Precharge

The precharge command can be asserted anytime after t_{RAS}(min.) is satisfied.

Soon after the precharge command is asserted, the precharge operation is performed and the synchronous DRAM enters the idle state after t_{RP}(min.) is satisfied. The parameter t_{RP} is the time required to perform the precharge.

The earliest timing in a read cycle that a precharge command can be asserted without losing any data in the burst is as follows.



In order to write all data to the memory cell correctly, the asynchronous parameter t_{DPL} must be satisfied. The t_{DPL}(min.) specification defines the earliest time that a precharge command can be asserted. The minimum number of clocks can be calculated by dividing t_{DPL}(min.) with the clock cycle time.

In summary, the precharge command can be asserted relative to the reference clock that indicates the last data word is valid. In the following table, minus means clocks before the reference; plus means time after the reference.

$\overline{CAS}$ latency	Read	Write
2	-1	+ t_{DPL}((min.)
3	-2	+ t_{DPL}((min.)

Auto Precharge

During a read or write command cycle, A10 controls whether auto precharge is selected. If A10 is high in the read or write command (Read with Auto precharge command or Write with Auto precharge command), auto precharge is selected and begins automatically.

In the write cycle, t_{DAL}(min.) must be satisfied before asserting the next activate command to the bank being precharged. When using auto precharge in the read cycle, knowing when the precharge starts is important because the next activate command to the bank being precharged cannot be executed until the precharge cycle ends. Once auto precharge has started, an activate command to the bank can be asserted after t_{RP} has been satisfied.

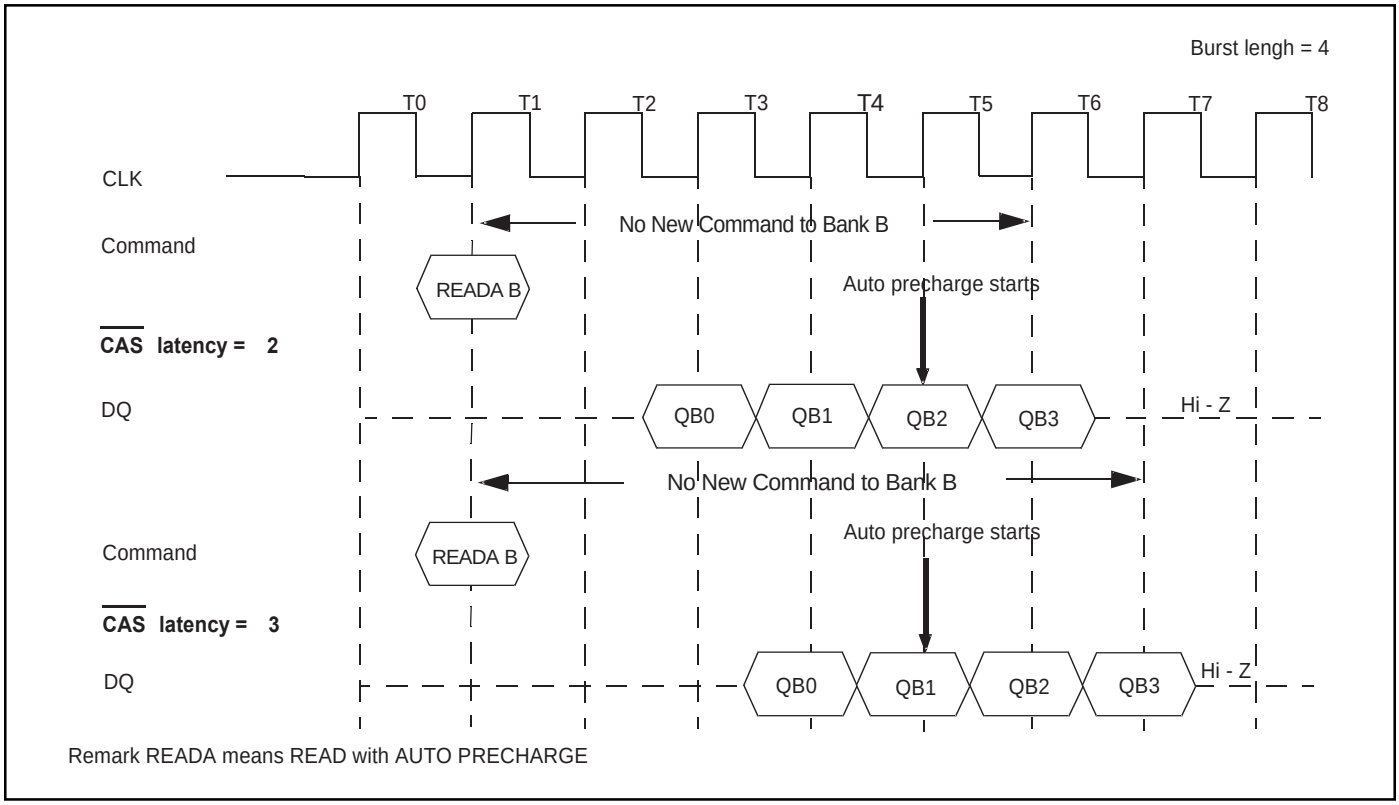
A Read or Write command without auto - precharge can be terminated in the midst of a burst operation. However, a Read or Write command with auto - precharge can not be interrupted by the same bank commands before the entire burst operation is completed. Therefore use of the same bank Read, Write, Precharge or Burst Stop command is prohibited during a read or write cycle with auto - precharge. It should be noted that the device will not respond to the Auto - Precharge command if the device is programmed for full page burst read or write cycles.

The timing when the auto precharge cycle begins depends both on both the $\overline{CAS}$ latency programmed into the mode register and whether the cycle is read or write.

Read with Auto Precharge

During a READA cycle, the auto precharge begins one clock earlier (CL = 2) or two clocks earlier (CL = 3) than the last word output.

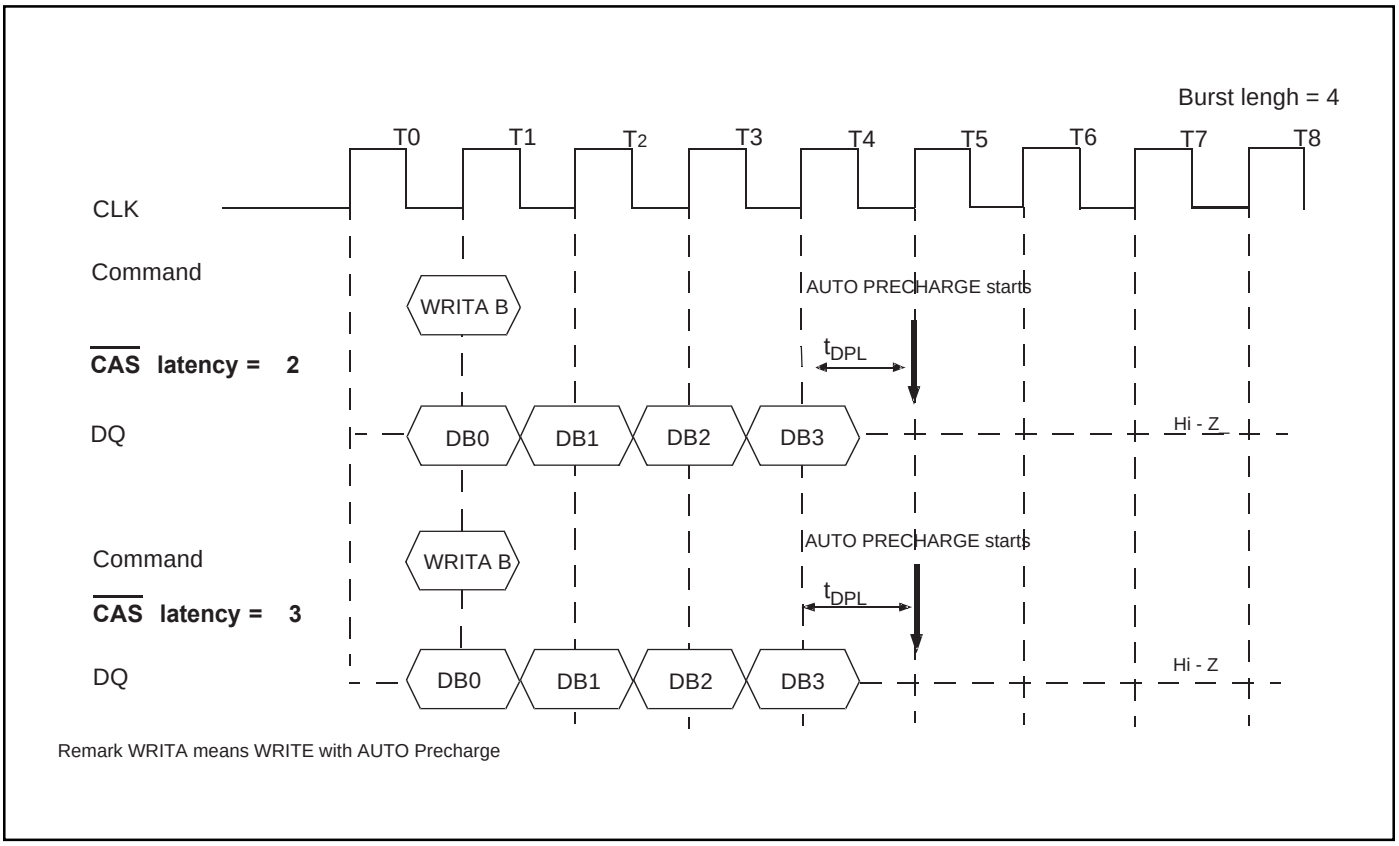
READ with AUTO PRECHARGE



Write with Auto Precharge

During a write cycle, the auto precharge starts at the timing that is equal to the value of t_{DPL}(min.) after the last data word input to the device.

WRITE with AUTO PRECHRGE



In summary, the auto precharge cycle begins relative to a reference clock that indicates the last data word is valid. In the table below, minus means clocks before the reference; plus means clocks after the reference.

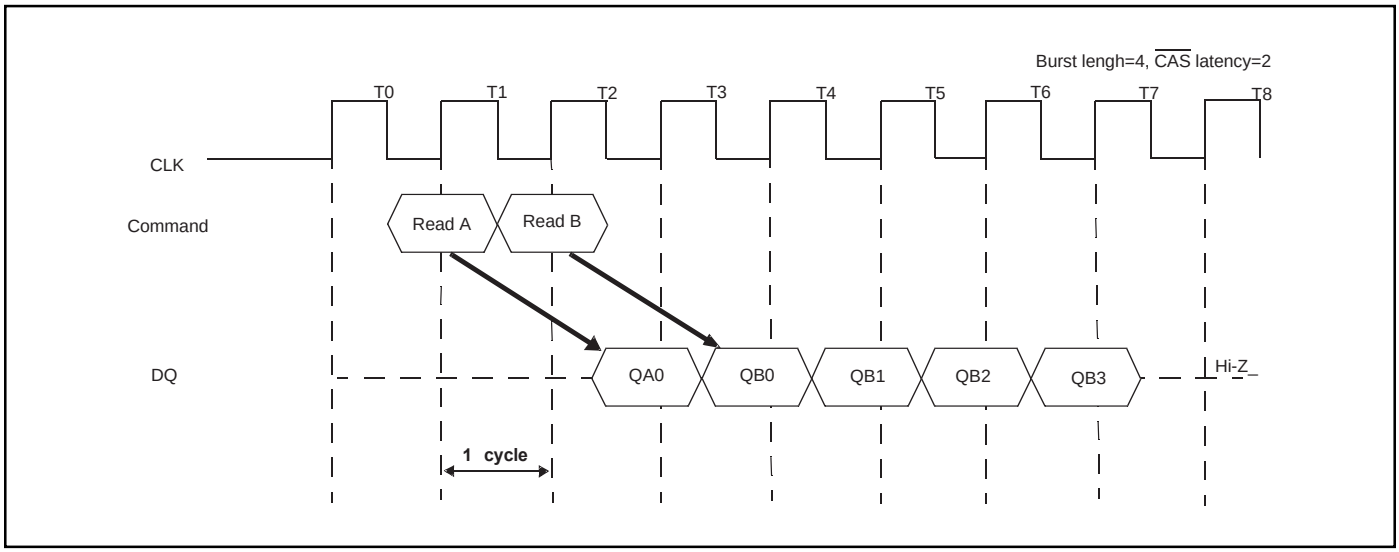
$\overline{CAS}$ latency	Read	Write
2	-1	+ t_{DPL}((min.)
3	-2	+ t_{DPL}((min.)

Read / Write Command Interval

Read to Read Command Interval

During a read cycle when a new read command is asserted, it will be effective after the $\overline{CAS}$ latency, even if the previous read operation has not completed. READ will be interrupted by another READ.
Each read command can be asserted in every clock without any restriction.

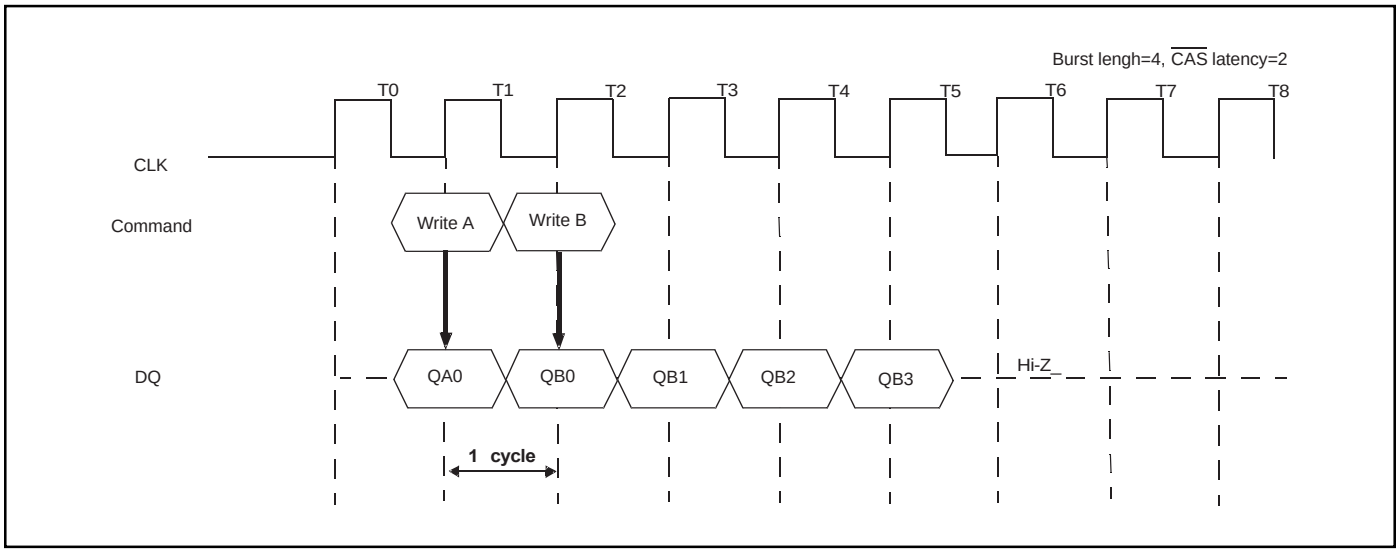
READ to READ Command Interval



Write to Write Command Interval

During a write cycle, when a new Write command is asserted, the previous burst will terminate and the new burst will begin with a new write command. WRITE will be interrupted by another WRITE.
Each write command can be asserted in every clock without any restriction.

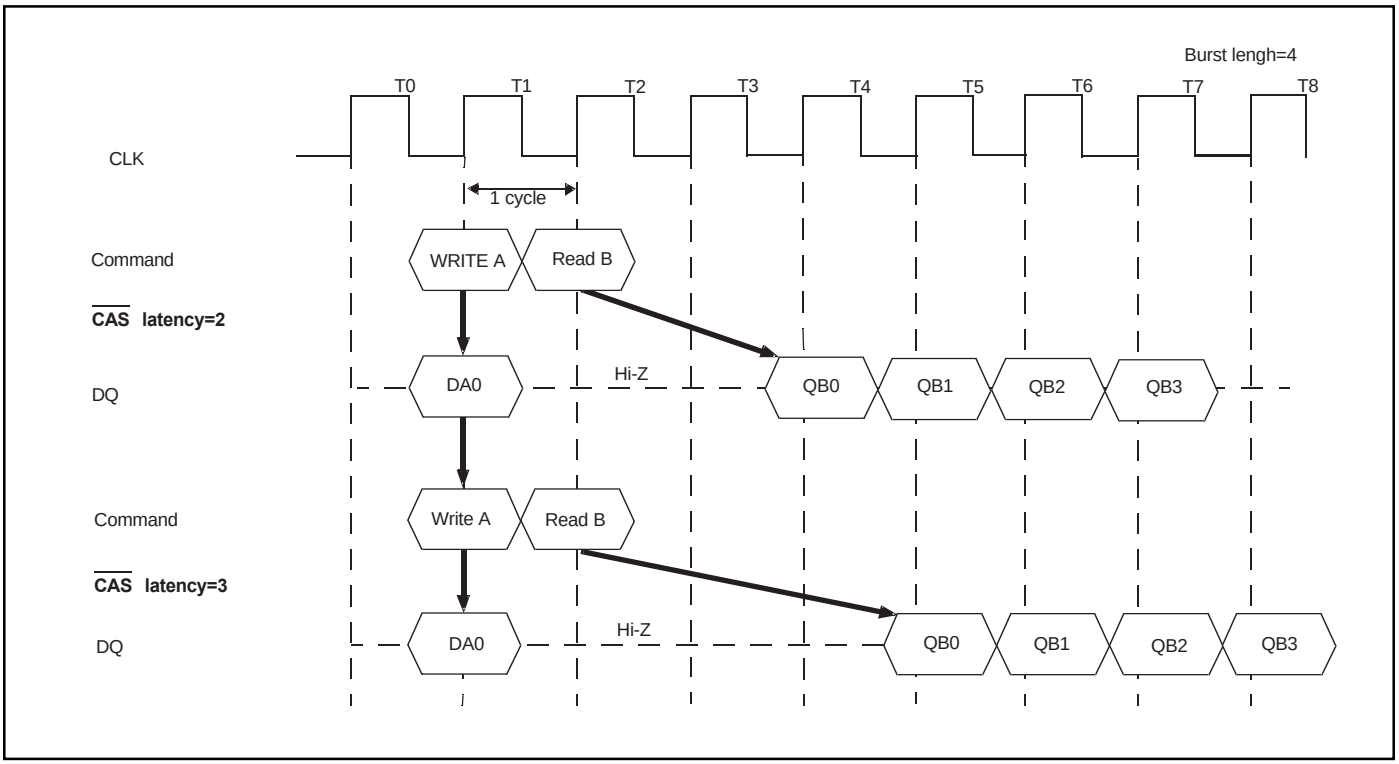
WRITE to WRITE Command Interval



Write to Read Command Interval

The write command to read command interval is also a minimum of 1 cycle. Only the write data before the read command will be written. The data bus must be Hi-Z at least one cycle prior to the first DOUT.

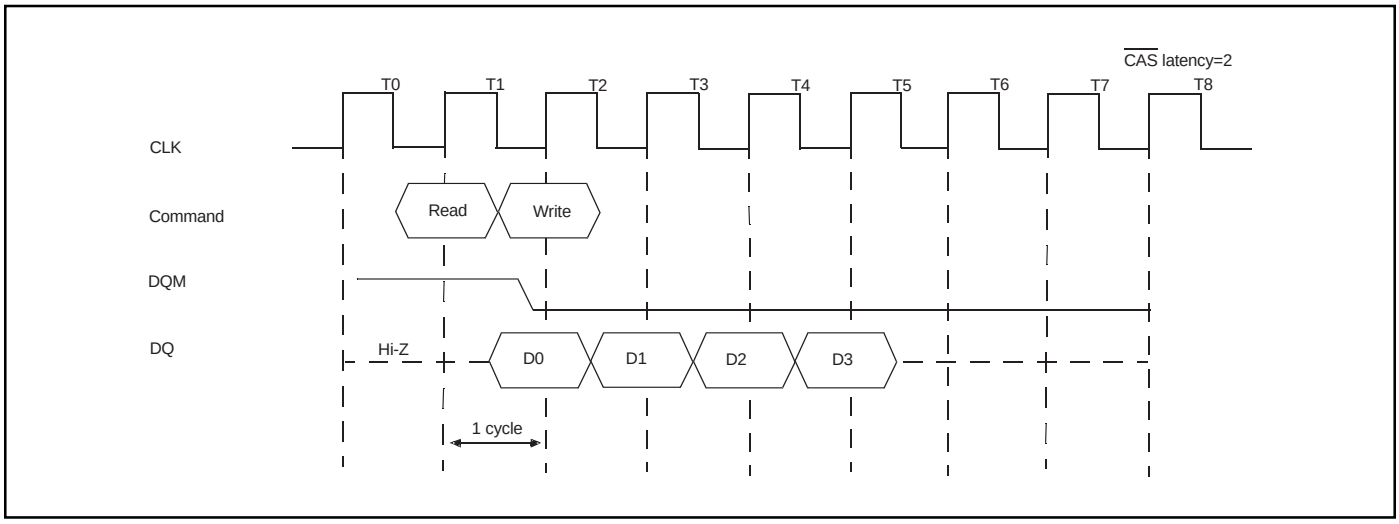
WRITE to READ Command Interval

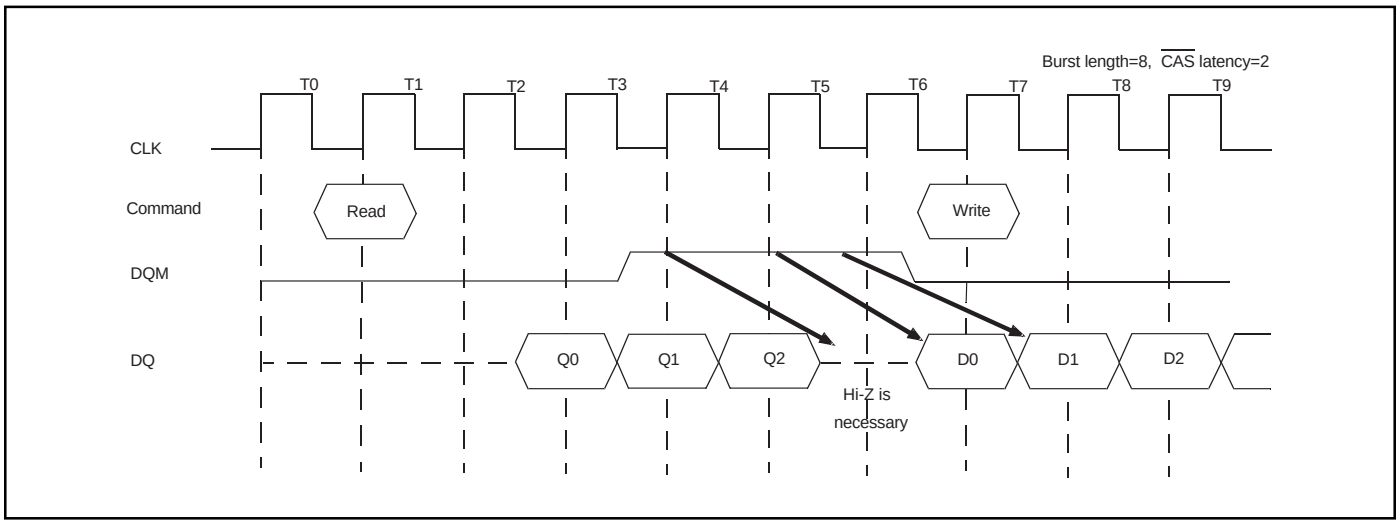


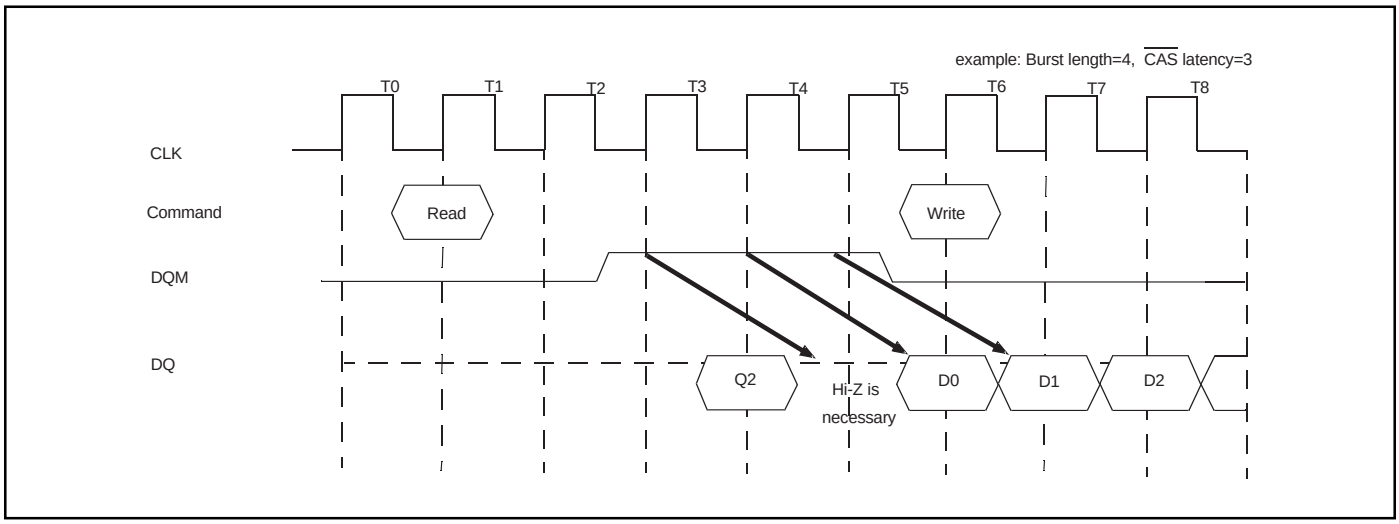
Read to Write Command Interval

During a read cycle, READ can be interrupted by WRITE.
DQM must be in High at least 3 clocks prior to the write command. There is a restriction to avoid a data conflict. The data bus must be Hi-Z using DQM before Write.

READ to WRITE Command Interval







BURST Termination

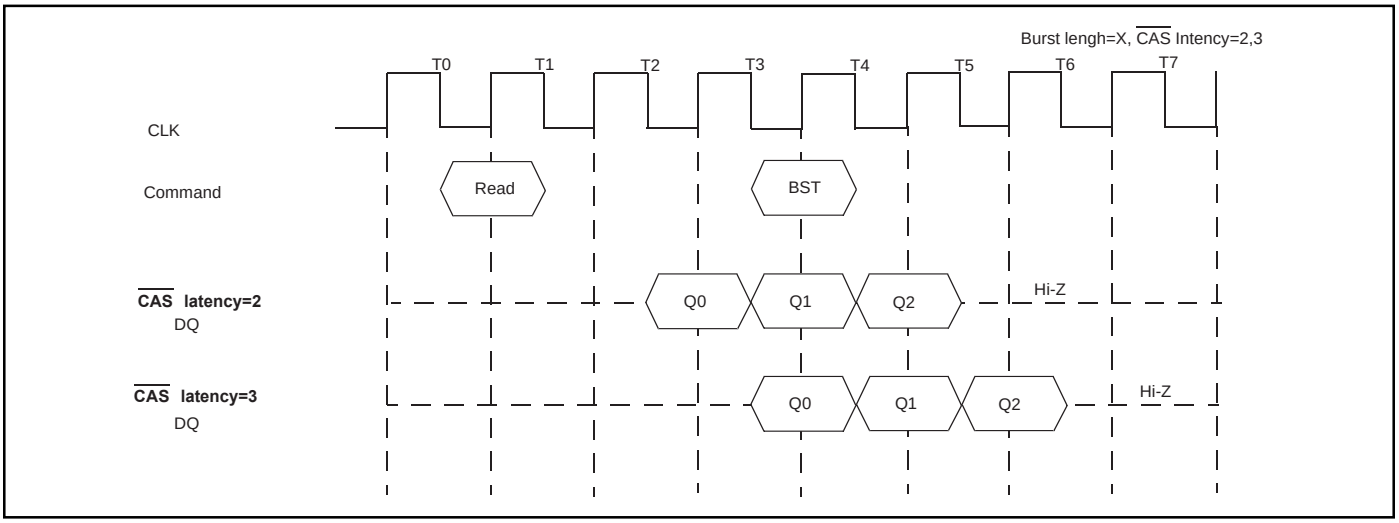
There are two methods to terminate a burst operation other than using a read or a write command. One is the burst stop command and the other is the precharge command.

BURST Stop Command

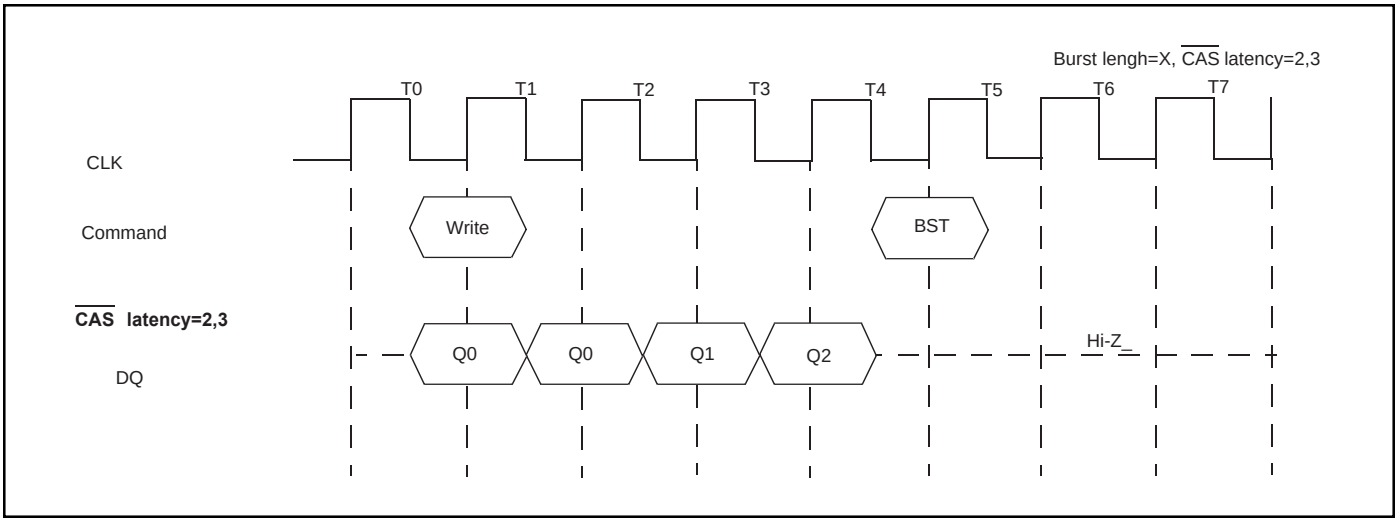
During a read burst, when the burst stop command is issued, the burst read data are terminated and the data bus goes to high-impedance after the $\overline{CAS}$ latency from the burst stop command.

During a write burst, when the burst stop command is issued, the burst write data are termained and data bus goes to Hi-Z at the same clock with the burst stop command.

Burst Termination



Remark BST: Burst stop command



Remark BST: Burst command

PRECHARGE TERMINATION

PRECHARGE TERMINATION in READ Cycle

During READ cycle, the burst read operation is terminated by a precharge command.

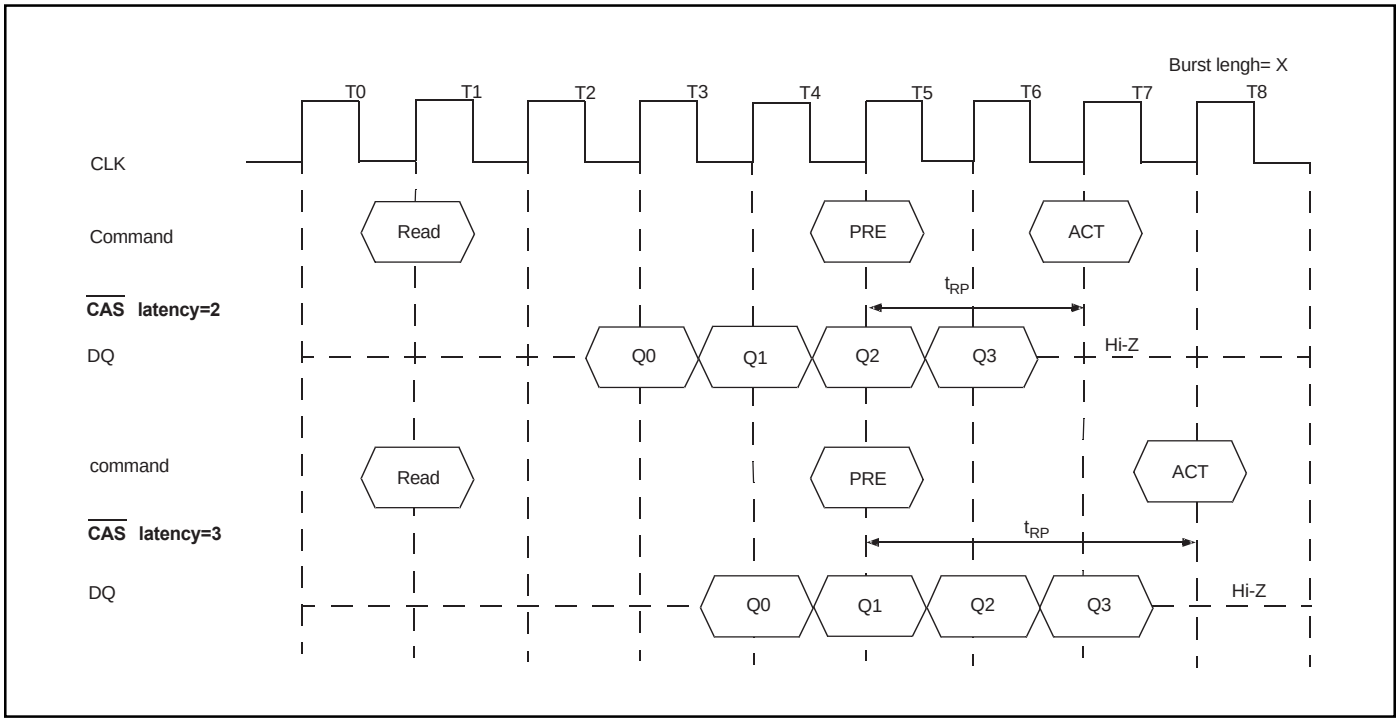
When the precharge command is issued, the burst read operation is terminated and precharge starts.

The same bank can be activated again after t_{RP} from the precharge command.

When $\overline{CAS}$ latency is 2, the read data will remain valid until one clock after the precharge command.

When $\overline{CAS}$ latency is 3, the read data will remain valid until two clocks after the precharge command.

Precharge Termination in READ Cycle



Precharge Termination in WRITE Cycle

During WRITE cycle, the burst write operation is terminated by a precharge command.

When the precharge command is issued, the burst write operation is terminated and precharge starts.

The same bank can be activated again after t_{RP} from the precharge command. The DQM must be high to mask invalid data in.

During WRITE cycle, the write data written prior to the precharge command will be correctly stored. However, invalid data may be written at the same clock as the precharge command. To prevent this from happening, DQM must be high at the same clock as the precharge command. This will mask the invalid data.

PRECHARGE TERMINATION in WRITE Cycle
